
- Select **Show Attributes and Methods** on the context menu of the **Class Library** to show the *methods*, *read-only attributes*, and *attributes* of the selected **Class [general description]**.
- Press the **F8** key or click **Show Attributes and Methods** on the **Home** ribbon tab of the *Frame* into which you inserted an instance to show the *methods*, *read-only attributes*, and *attributes* of the selected **Instance [general description]**.

To query the value of a *read-only attribute*, you might, for example, type:

```
print MyStation.UUID
```

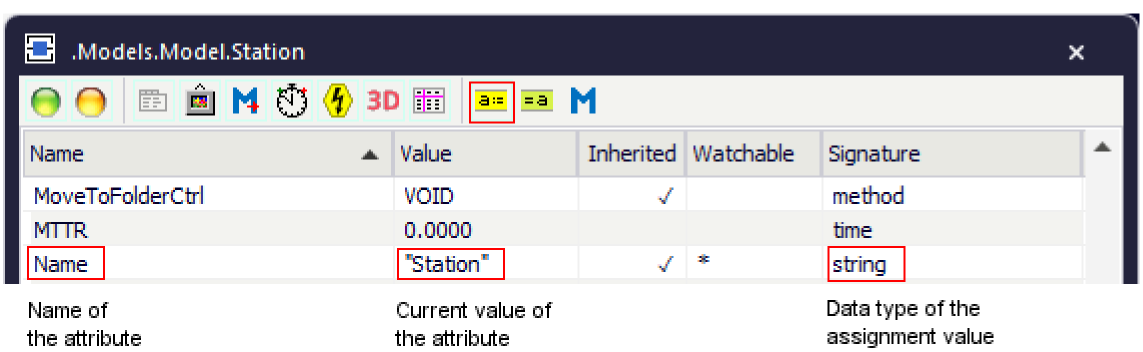
Attributes of the Station

Attributes of the Station

The *Station* provides:

- The **Attributes of All Objects**.
- The **Attributes of the Material Flow Objects**.

To view all of the *methods*, *read-only attributes*, and *attributes* of the object, open the window **Show Attributes and Methods**. The figure below illustrates the information using the example of the object *Station*.



- Select **Show Attributes and Methods** on the context menu of the **Class Library** to show the *methods*, *read-only attributes*, and *attributes* of the selected **Class [general description]**.
- Press the **F8** key or click **Show Attributes and Methods** on the **Home** ribbon tab of the *Frame* into which you inserted an instance to show the *methods*, *read-only attributes*, and *attributes* of the selected **Instance [general description]**.

You can set the value of an attribute and you can get its value, either with the check boxes, the text boxes and drop-down lists in the dialog windows or by assigning values to the respective attributes.

- To **set the value** of an attribute, you might, for example, type:

```
MyStation.Pause := true
```

- To **get the value** of an attribute, you might, for example, type:

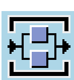
```
print MyStation.Pause
posit := MyStation.Cont.XPos
```

ParallelStation

ParallelStation

Use the object *ParallelStation* for modeling machines for processing several parts in parallel at the same time.

Image



Description

The built-in properties of the *ParallelStation* are the same as those of the *Station*. The *ParallelStation* has several processing places as opposed to the single processing place of the *Station*. A set-up time always applies if a *MU* has a different name than the *part* it processed before, i.e., its predecessor. *Plant Simulation* always moves the *MU* as a whole not continually, i.e., as soon as its front is located on the *ParallelStation*, the entire *MU* is located on it.

On the tab **MU Animation** you can set how the parts are distributed on the **Animation Area** of the *ParallelStation*.

To show a **tooltip** with information about the *ParallelStation*, hover with the mouse over it.
