

You can use the user-defined boolean attributes *ShowRuntimeAtEnd*, *AskForSaveModel*, and *ShowHTMLatEnd* (for the distributed simulation) to prevent opening any message dialogs.

When you set the user-defined attribute *ShowHTMLatEnd* to `false`, *Plant Simulation* does not open the *Report* at the end of the optimization.

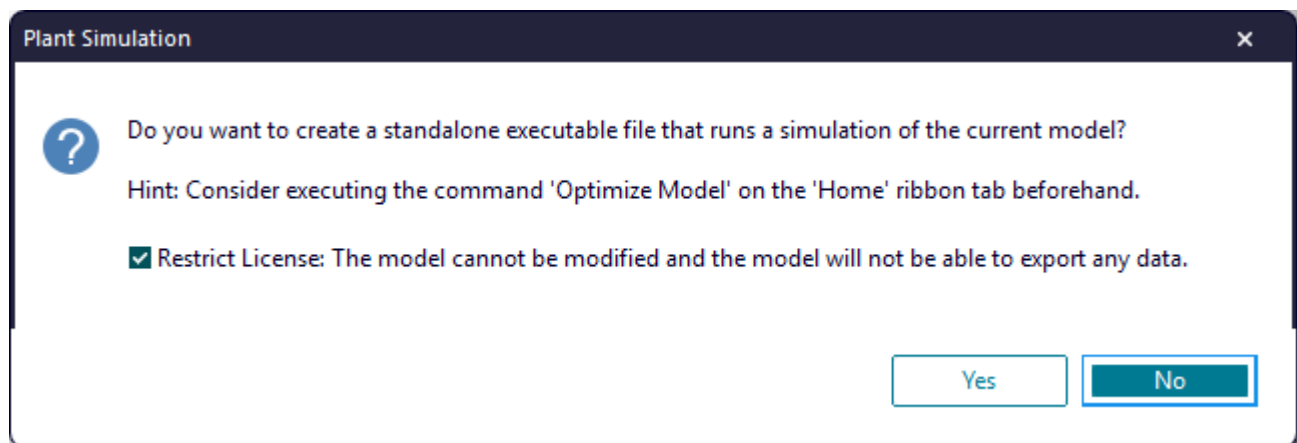

To change the values of these attributes, click the *GAWizard* in the *Frame* into which you inserted it and press the **F8** key. Double-click the name of the attribute to change the value to `false`.

Pack a Model and Send It to Another User

Here we demonstrate how to pack and send a *Plant Simulation* model with *Pack & Go* to somebody, who does not have *Plant Simulation* installed on his computer.

When you create a *Pack and Go model*, you can select if you want to restrict the permissions to a **Plant Simulation Viewer License**. If the check box is not selected, you can pass the license to be used with the start parameter */L* to the *Pack&Go application*. This enables you to use features of the superior license, provided this license is available. If you do not specify the start parameter, the freely available **Viewer license** will be used.

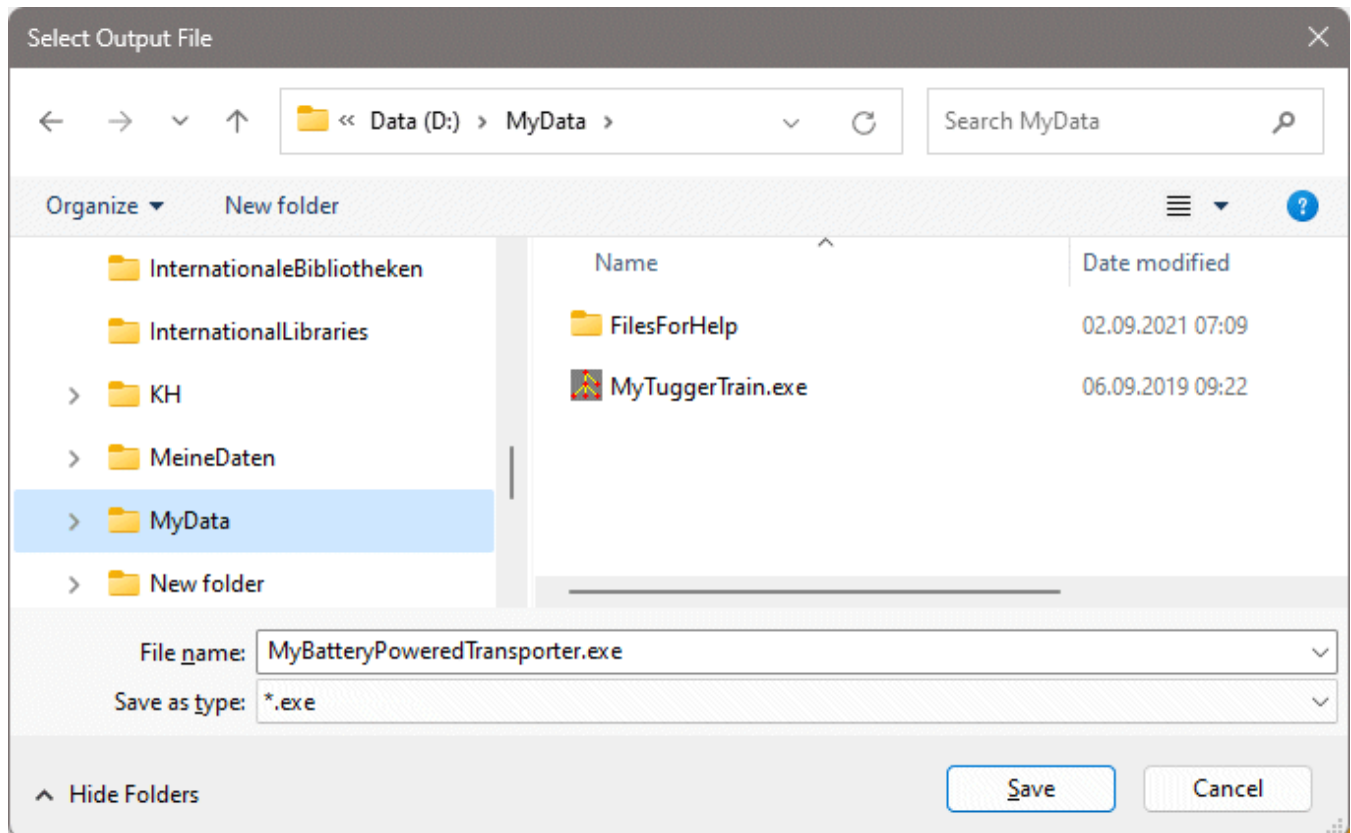

Pack and Go takes all files needed for starting the selected simulation model with a **Plant Simulation Viewer License**, packs the files, and saves them as a self-extracting executable. You can send this packed model to a customer for example, who can open the model by double-clicking it.

Note

The **Pack and Go** executable does not include all *Plant Simulation* features, even if you do not restrict the license. As we want the executable to be as small as possible, we do not include the entire *Plant Simulation* installation. This prevents you from using the *OPCUA Interface* or the *Teamcenter Interface* in *Plant Simulation* for example.

- To start *Pack and Go*, select **File > Share > Pack and Go** in the *Plant Simulation* window.
- To save your model, before sending it, click **Yes** in the dialog that opens.
- Navigate to the folder into which you want to save the model file. Enter a name and click **Save**.

- Click **OK** after *Pack-and-Go* successfully created the package. Then, distribute the file, for example by sending it as an e-mail or by putting it in your Intranet, etc.
